

OV6630 SINGLE-CHIP CMOS CIF COLOR DIGITAL CAMERA OV6130 SINGLE-CHIP CMOS CIF B&W DIGITAL CAMERA

Features

- 101,376 pixels, 1/4" lens, CIF/QCIF format
- Progressive scan read out
- Data format YCrCb 4:2:2, GRB 4:2:2, RGB Raw Data
- 8/16 bit video data: ITU-601, ITU-656, ZV port
- Wide dynamic range, anti-blooming, zero smearing
- Electronic exposure/gain/white balance control
- Image enhancement brightness, contrast, gamma, saturation, sharpness, window, etc.
- Internal/external synchronization

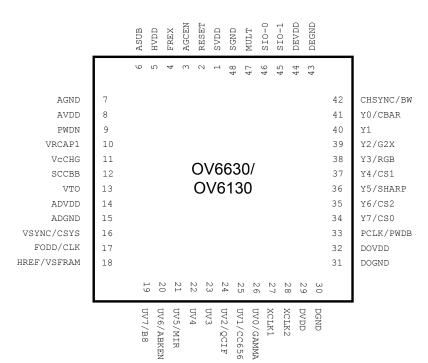

General Description

The OV6630 (color) and OV6130 (black and white) CMOS Image sensors are single-chip video/imaging camera devices designed to provide a high level of functionality in a single, small-footprint package. Both devices incorporate a 352 x 288 image array capable of operating up to 60 frames per second image capture. Proprietary sensor technology utilizes advanced algorithms to cancel Fixed Pattern Noise (FPN), eliminate

- Frame exposure/line exposure option
- 3.3-Volt operation, low power dissipation
 - < 20 mA active power
 - < 10 μ A in power-save mode
- Gamma correction (0.45/0.55/1.00)
- SCCB programmable:
 - Color saturation, brightness, contrast, white balance, exposure time, gain

smearing, and drastically reduce blooming. All needed camera functions including exposure control, gamma, gain, white balance, color matrix, windowing, and more, are programmable through an SCCB interface. Both devices can be programmed to provide image output in 4-bit, 8-bit or 16-bit digital formats.

Applications include: Video Conferencing, Video Phone, Video Mail, Still Image, and PC Multimedia.

1 Function Description

(Note: References to color features do not apply to the OV6130 B&W Digital Image Sensor.)

1.1 Overview

Referring to Figure 2 below, the OV6630 sensor includes a 356 x 292 resolution image array, an analog signal processor, dual 8-bit A/D converters, analog video multiplexer, digital data formatter, video port, SCCB interface, registers, and digital controls that include timing block, exposure control, black level control, and white balance.

The OV6630/OV6130 sensor is a ¼ inch CMOS imaging device. The sensor contains approximately 101,376 pixels (352x288). Its design is based on a field integration read-out system with line-by-line transfer and an electronic shutter with a synchronous pixel read out scheme. The color filter of the sensor consists of a primary color RG/GB array arranged in line-alternating fashion.

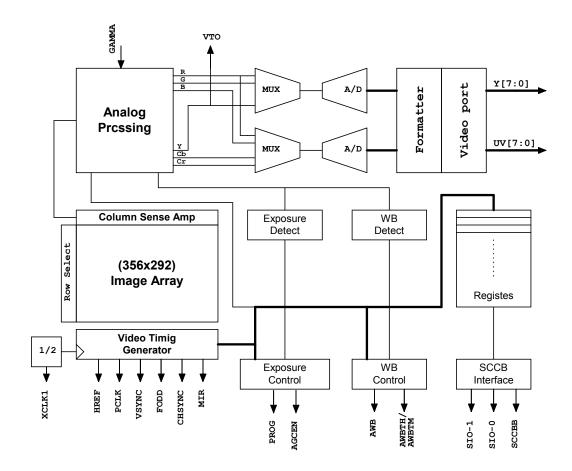

Figure 2. OV6630/OV6130 CMOS Image Sensor Block Diagram

1.2 Analog Processor Circuits

1.2.1 Overview

The image is captured by the 356 x 292 pixel image array and routed to the analog processing section where the majority of signal processing occurs. This block contains the circuitry that performs color separation, color correction, automatic gain control (AGC), gamma correction, color balance, black level calibration, "knee" smoothing, aperture correction, controls for picture luminance and chrominance, and anti-alias filtering. The analog video signals are based on the following formula:

$$Y = 0.59G + 0.31R + 0.11B$$

 $U = R - Y$

$$V = B - Y$$

Where R,G,B are the equivalent color components in each pixel.

YCrCb format is also supported, based on the formula below:

$$Y = 0.59G + 0.31R + 0.11B$$

 $Cr = 0.713 (R - Y)$

$$Cb = 0.564 (B - Y)$$

The YCrCb/RGB data signal from the analog processing section is fed to two on-chip 8-bit analog-to-digital (A/D) converters: one for the Y/RG channel and one shared by the CrCb/BG channels. The converted data stream is further conditioned in the digital formatter. The processed signal is delivered to the digital video port through the video multiplexer which routes the user-selected 16-, 8-, or 4-bit video data to the correct output pins.

The on-chip 8-bit A/D operates up to 9 MHz, and fully synchronous to the pixel rate. Actual conversion rate is related to the frame rate. A/D black-level calibration circuitry ensures:

- ⇒ The black level of Y/RGB is normalized to a value of 16
- ⇒ The peak white level is limited to 240
- ⇒ CrCb black level is 128
- ⇒ CrCb Peak/bottom is 240/16
- ⇒ RGB raw data output range is 16/240

(Note: Values 0 and 255 are reserved for sync flag)

1.2.2 Image Processing

The algorithm used for the electronic exposure control is based on the brightness of the full image. The exposure is optimized for a "normal" scene that assumes the subject is well lit relative to the background. In situations where the image is not well lit, the automatic exposure control (AEC) white/black ratio may be adjusted to suit the needs of the application.

Additional on-chip functions include

- ⇒ AGC that provides a gain boost of up to 24dB
- White balance control that enables setting of proper color temperature and can be programmed for automatic or manual operation.
- ⇒ Separate saturation, brightness, contrast, and sharpness adjustments allow for further fine-tuning of the picture quality and characteristics.

The OV6630 image sensor also provides control over the White Balance ratio for increasing/decreasing the image field Red/Blue

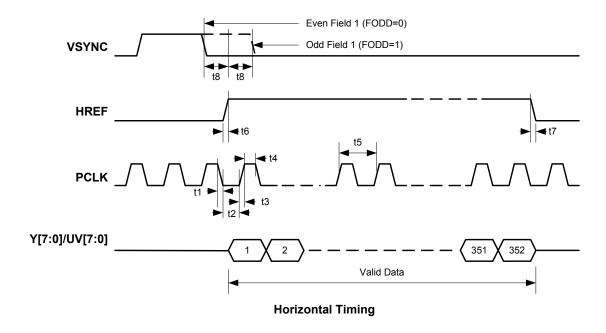

component ratio. The sensor provides a default setting that may be sufficient for many applications.

1.2.3 Windowing

The windowing feature of the OV6630/OV6130 image sensors allows user-definable window sizing as required by the application. Window size setting (in pixels) ranges from 2 x 2 to 356 x 292, and can be positioned anywhere inside the 356 x 292 boundary. Note that modifying window size and/or position does not change frame or data rate. The OV6630/OV6130 imager alters the assertion of the HREF signal to be consistent with the programmed horizontal and vertical region. The default output window is 352 x 288.

1.2.4 Zoom Video Port (ZV)

The OV6630/OV6130 image sensor includes a Zoom Video (ZV) function that supports standard ZV Port interface timing. Signals available include VSYNC, CHSYNC, PCLK and 16-bit data bus: Y[7:0] and UV[7:0]. The rising edge of PCLK clocks data into the ZV port. See Figure 3. Zoom Video Port Timing below.

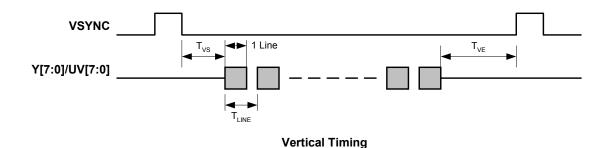

Figure 3. Zoom Video Port Timing

Notes:

1. Zoom Video Port format output signal includes:

VSYNC: Vertical sync pulse.

HREF: Horizontal valid data output window.

PCLK: Pixel clock used to clock valid data and CHSYNC into Zoom V Port. Default frequency is 8.86MHz when use 17.73MHz as system clock. Rising edge of PCLK is used to clock the 16 Bit data.

Y[7:0]: 8 Bit luminance data bus.

UV[7:0]: 8 Bit chrominance data bus.

2. All timing parameters are provided in Table 13. Zoom Video Port AC Parameters.

1.2.5 QCIF Format

A QCIF mode is available for applications where higher resolution image capture is not required. Only half of the pixel rate is required when programmed in this mode. Default resolution is 176 x 144 pixels and can be programmed for other resolutions. Refer to Table 7. QCIF Digital Output Format (YUV beginning of line) and Table 8. QCIF Digital Output Format (RGB raw data beginning of line) for further information.

1.2.6 Video Output

The video output port of the OV6630/OV6130 image sensors provides a number of output format/standard options to suit many different application requirements. Table 2. Digital Output Format, below, indicates the output formats available. These formats are user programmable through the SCCB interface.

The OV6630/OV6130 imager supports both ITU-601 and ITU-656 output formats in the following configurations (See Table 3. 4:2:2 16-bit Format for further details):

- 16-bit, 4:2:2 format

(This mode complies with the 60/50 Hz ITU-601 timing standard. See Table 3. 4:2:2 16-bit Format below)

- 8-bit data mode

(In this mode, video information is output in Cb Y Cr Y order using the Y port only and running at twice the pixel rate during which the UV port is inactive. See Table 4. 4:2:2 8-bit Format below)

- 4-bit nibble mode

(In the nibble mode, video output data appears at bits Y4-Y7. The clock rate for the output runs at twice the normal output speed when in B/W mode, and 4 times the normal output speed in when in color mode.)

- 704 x 288 format

(When programmed in this mode, the pixel clock is doubled and the video output sequence is $Y_0Y_0Y_1Y_1 \cdots$ and $U_0U_0V_0V_0 \cdots$. See Figure 4. Pixel Data Bus (YUV Output) below.)

The OV6630/OV6130 imager provides VSYNC, HREF, PCLK, FODD, and CHSYNC as standard output video timing signals.

The OV6630/OV6130 imager can also be programmed to provide RGB raw data in 16-bit, 8-bit, and 4-bit format. The output sequence is matched to the OV6630 color filter pattern (See Figure 5. Pixel Data Bus (RGB Output) below):

- Y channel output sequence is G R G R
- UV channel output sequence is B G B G

The video output appears in Y channel only and the UV channel is disabled in 8-bit RGB raw data. The output sequence is B G R G.

In RGB raw data ITU-656 modes, the OV6630/OV6130 imager asserts SAV (Start of Active Video) and EAV (End of Active Video) to indicate the beginning and the ending of HREF window. As a result, SAV and EAV change with the active pixel window. The 8-bit RGB raw data is also accessible without SAV and EAV information.

The OV6630/OV6130 imager offers flexibility in YUV output format. The device may be programmed as standard YUV 4:2:2. The device may also be configured to "swap" the UV sequence. When swapped, the UV channel output sequence in the 16-bit configuration becomes:

- VUVU···.

The 8-bit configuration becomes:

- V Y U Y · · · .

The third format available in the 8-bit configuration is the Y/UV sequence swap:

- Y U Y V · · · .

The single-chip camera can be configured for use as a black and white image device. The vertical resolution is higher than in color mode. Video data output is provided at the Y port and the UV port is tristated. The data (Y/RGB) rate is equivalent to 16-bit in color mode.

The MSB and LSB of Y/UV or RGB output can be reversed. Y7 is MSB and Y0 is LSB in the default setting. Y7 becomes LSB and Y0 becomes MSB in the reserve order configuration. Y2-Y6 are also reversed appropriately.

| Resolution | Pixel Clock | 352 x 288 | 704 x 288 | 176 x 144 |
|------------------------|----------------------|-----------|-----------|-----------|
| YUV 4:2:2 | 16-bit | Y | Y | Y |
| | 8-bit | Y | Y | Y |
| | ITU-656 | Y | Y | Y |
| | Nibble | Y | Y | Y |
| RGB | 16-bit | Y | Y | Y |
| | 8-bit | Y | Y | Y |
| | ITU-656 ¹ | Y | Y | Y |
| | Nibble | Y | Y | Y |
| Y/UV swap ² | 16-bit | | | |
| | 8-bit | Y | Y | Y |
| U/V swap | YUV ³ | Y | Y | Y |
| | RGB ⁴ | Y | Y | Y |
| YG | 16-bit | Y | Y | Y |
| | 8-bit | | | |
| One Line | 16-bit | Y | | |
| | 8-bit | | | |
| MSB/LSB swap | | Y | Y | Y |

Note:

("Y" indicates mode/combination is supported by OV6630/OV6130)

- Output is 8-bit in RGB ITU-656 format. SAV and EAV are inserted at the beginning and ending of HREF, which
 synchronize the acquisition of VSYNC and HSYNC. 8-bit data bus configuration (without VSYNC and
 CHSYNC) can provide timing and data in this format.
- 2. Y/UV swap is valid in 8-bit only. Y channel output sequence is Y U Y V · · ·

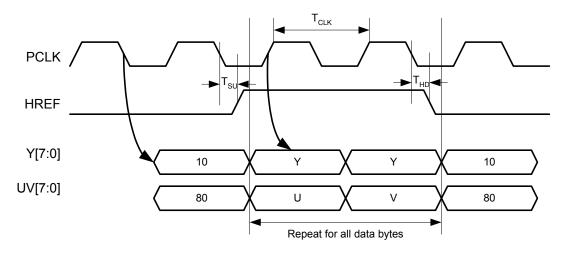

- 3. U/V swap means UV channel output sequence swap in YUV format, i.e., V U V U \cdots for 16 bit and V Y U Y \cdots for 8-bit.
- 4. U/V swap means neighbor row B R output sequence swap in RGB format. Refer to RGB raw data output format for further details.

Notes:

- A. Y port output data sequence: G R G R G R ··· or G G G G ···; UV port output data sequence: B G B G B G ··· or B R B R ···; and the array color filter pattern is Bayer-Pattern.
- B. Output Modes
 - 1. 16-bit Format (Total 292 HREFs)

Default mode:

- 1st HREF Y channel output unstable data, UV output B₁₁ G₁₂ B₁₃ G₁₄ · · ·
- 2nd HREF Y channel output G_{21} R_{22} G_{23} R_{24} \cdots , UV output B_{11} G_{12} B_{13} G_{14} \cdots
- 3rd HREF Y channel output G_{21} R_{22} G_{23} R_{24} ···, UV output B_{31} G_{23} B_{33} G_{34} ···
- Every line of data is output twice.

YG mode:

- 1st HREF Y and UV output unstable data.
- 2nd HREF Y channel output G_{21} G_{12} G_{23} G_{14} · · · , UV output B_{11} R_{22} B_{13} R_{24} · · ·
- 3rd HREF Y is G_{21} G_{32} G_{23} G_{34} \cdots , UV channel is B_{31} R_{22} B_{33} R_{24} \cdots
- Every line data output twice.

One line mode:

- 1st HREF Y channel output $B_{11} G_{12} B_{13} G_{14} \cdots$
- 2nd HREF Y channel output G_{21} R_{22} G_{23} R_{24} · · ·
- UV channel tri-state.

2. 8-bit Format (Total 292 HREFs)

- 1st HREF Y channel output unstable data.
- 2nd HREF Y channel output B₁₁ G₂₁ R₂₂ G₁₂ ···
- 3rd HREF Y channel output $B_{31} G_{21} R_{22} G_{32} \cdots$
- PCLK timing is doubled and PCLK rising edge latch data bus. UV channel tri-state. Every line data output twice.

3. 4-bit Nibble Mode Output Format

- Uses higher 4 bits of Y port (Y[7:4]) as output port.
- Supports YCrCb/RGB data, ITU-601/ITU-656 timing, Color/B&W.
- Output sequence: High order 4 bits followed by lower order 4 bits

 $Y0_H Y0_L Y1_H Y1_L \cdots$ $U0_H U0_L V0_H V0_L \cdots$

For B/W or one-line RGB raw data, the output data clock speed is doubled. For color YUV, output clock is four times that of the 16-bit output data. In color mode, sensor must be set to 8-bit mode, and the nibble timing, clock divided by 2.

Output sequence: $U0_H U0_L Y0_H Y0_L V0_H V0_L Y1_H Y1_L \cdots$

1.2.7 Slave Mode Operation

The OV6630/OV6130 can be programmed to operate in slave mode (COMI[6] = 1, default is master mode). HSYNC and VSYNC output signals are provided.

When used as a slave device, the external master must provide the following clocks to OV6630/OV6130 imager:

- 1. System clock CLK to XCLK1 pin
- 2. Horizontal sync, HSYNC, to CHSYNC pin, positive assertion
- 3. Vertical frame sync, VSYNC, to VSYNC pin, positive assertion

In slave mode, the OV6630/OV6130 tri-states CHSYNC (pin 42) and VSYNC (pin 16) output pins, and used as input pins. To synchronize multiple devices, OV6630/OV6130 uses external system clock, CLK, to synchronize external horizontal sync, HSYNC, which is then used to synchronize external vertical frame sync, VSYNC. See Figure 6. Slave Mode External Sync Timing for timing considerations.

1.2.8 Frame Exposure Mode

OV6630/OV6130 supports frame. FREX (pin 4) is asserted by an external master device to set exposure time. The pixel array is quickly pre-charged when FREX is set to "1". OV6630/OV6130 captures the image in the time period when FREX remains high. The video data stream is delivered to output port in a line-by-line manner after FREX switches to "0".

It should be noted that FREX must remain high long enough to ensure the entire image array has been pre-charged.

When data is being output from OV6630/OV6130, care must be taken so as not to expose the image array to light. This may affect the integrity of the image data captured. A mechanical shutter synchronized with the frame exposure rate can be used to minimize this situation. The timing of frame exposure is shown in Figure 7. Frame Exposure Timing below.

1.2.9 Reset

OV6630/OV6130 includes a RESET pin (pin 2) that forces a complete hardware reset when it is pulled high (VCC). OV6630/OV6130 clears all registers and resets to their default values when a hardware reset occurs. Reset can also be initiated through the SCCB interface.

1.2.10 Power Down Mode

Two methods are available to place OV6630/OV6130 into power-down mode: hardware power down and SCCB software power down.

To initiate hardware power down, the PWDN pin (pin 9) must be tied to high (\pm 3.3VDC). When this occurs, OV6630/OV6130 internal device clock is halted and all internal counters are reset. The current draw is less than \pm 10µA in this standby mode.

Executing a software power down through the SCCB interface suspends internal circuit activity, but does not halt the device clock. The current requirements drop to less than 1mA in this mode.

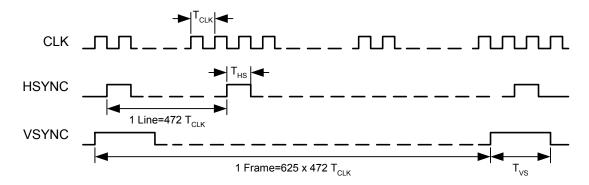

Configure OV6630/OV6130 1.2.11

Two methods are provided to configure OV6630/OV6130 for specific application requirements.

At power up, OV6630/OV6130 reads the status of certain pins to determine what, if any, power up pin programming default settings are requested. Once the reading of the external pins status is

completed, the device configures its internal registers according to the specified pins. Not all device functions are available for configuration through external pins. Power up pin programming occurs in 1024 system clock cycles from start or power apply to chip.

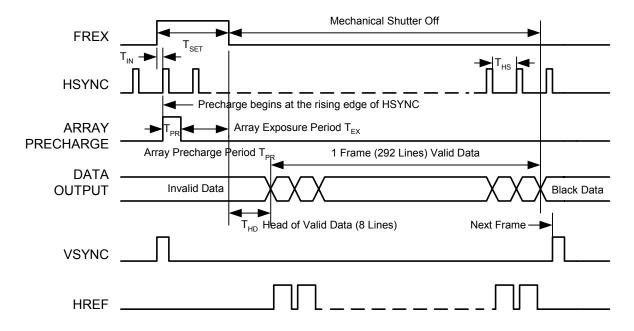

A more flexible and comprehensive method to configure OV6630/OV6130 is to use its on-chip SCCB register programming capability. The SCCB interface provides access to all of the device's programmable internal registers.

- T_{HS} > 6 T_{CLK} (2), T_{HS} < T_{VS} < 472 T_{CLK}
 HSYNC period is (472 T_{CLK})
 VSYNC period is (625 x 472 T_{CLK})

- OV6630/OV6130 will be stable after 1 field (2nd VSYNC)

Figure 6. Slave Mode External Sync Timing

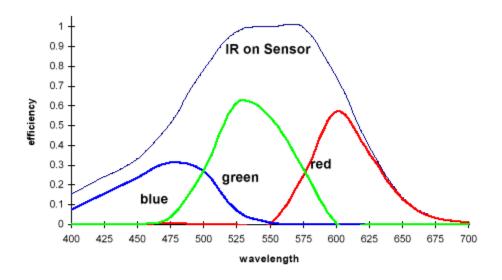

Note:

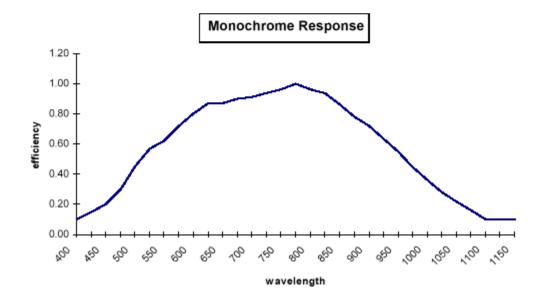

- T_{PR}=292 x 4 x T_{CLK}. T_{CLK} is internal pixel period. T_{CLK}=112ns if the system clock is 17.73MHz. T_{CLK} will increase with the clock divider CLK[5:0].
- $T_{\rm EX}$ is array exposure time which is decided by external master device.
- T_{IN} is uncertain time due to the using of HSYNC rising edge to synchronize FREX. $T_{IN} < T_{HS}$.
 There are 8 lines data output before valid data after FREX=0. T_{HD} =4 THS. Valid data is output when
- $T_{SET} = T_{IN} + T_{PR} + T_{EX}$. $T_{SET} > T_{PR} + T_{IN}$. The exposure time setting resolution is T_{HS} (one line) due to the uncertainty of T_{IN} .

Figure 7. Frame Exposure Timing

Normalized Spectrum Response

2 Electrical Characteristics

Table 10. DC Characteristics (0°C ≤ TA ≤ 85°C, Voltages referenced to GND)

| Symbol | Descriptions | Max | Тур | Min | Units |
|--------------------|--|----------------|----------|------------|-------|
| Supply | | | | | |
| V_{DD1} | Supply voltage (DEVDD, ADVDD, AVDD, SVDD, DVDD) | 3.6 | 3.3 | 3.0 | V |

| t_{PHD} | PCLK to HREF delay | 20 | 10 | 5 | ns |

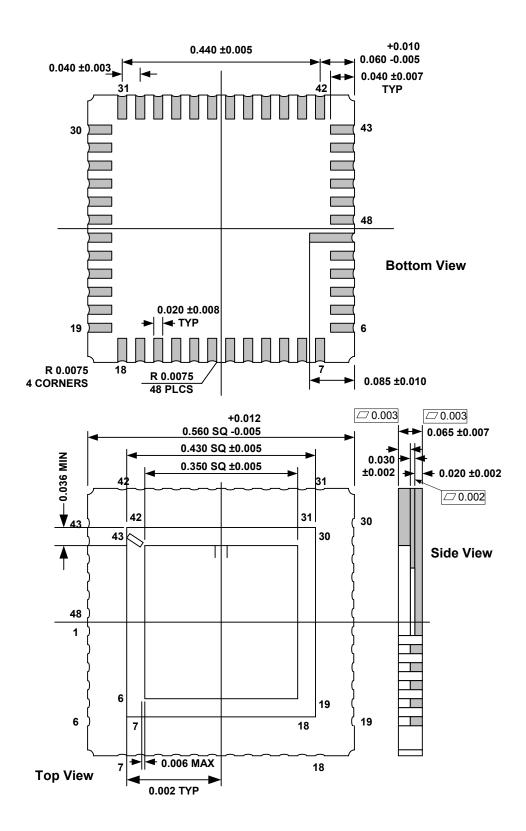

Table 13. Zoom Video Port AC Parameters

| Symbol | Parameter | Min | Max |
|--------|-------------------------------|-------|-----|
| t1 | PCLK fall time | 4ns | 8ns |
| t2 | PCLK low time | 50ns | |
| t3 | PCLK rise time | 4ns | 8ns |
| t4 | PCLK high time | 50ns | |
| t5 | PCLK period | 106ns | |
| t6 | Y/UV/HREF setup time | 10ns | |
| t7 | Y/UV/HREF hold time | 20ns | |
| t8 | VSYNC setup/hold time to HREF | 1µs | |

Notes:

- 1. In Interlaced Mode, there are even/odd field different (t8). When In Progressive Scan Mode, only frame timing same as Even field(t8).
- 2. After VSYNC falling edge, OV6630 will output black reference level, the line number is T_{VS}, which is the line number between the 1st HREF rising edge after VSYNC falling edge and 1st valid data CHSYNC rising edge. Then valid data, then black reference, line number is T_{VE}, which is the line number between last valid data CHSYNC rising edge and 1st CHSYNC rising edge after VSYNC rising edge. The black reference output line number is dependent on vertical window setting.
- 3. When in default setting, $T_{VE} = 14 \times T_{LINE}$, which is changed with register VS[7:0]. VS[7:0] step equal to 1 line.
- 4. When in default setting, $T_{VE} = 4 \times T_{LINE}$ for Odd Field, $T_{VE} = 3 \times T_{LINE}$ for Even Field, which is changed with register VE[7:0]. VE[7:0] step equal to 1 line.

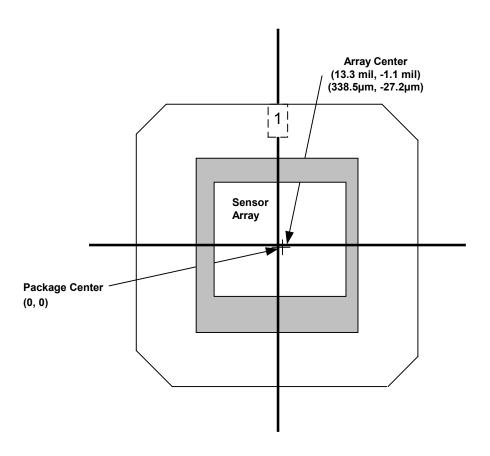

Table 14. Ordering Information

| Part Number | Description | Package |
|-------------|--|------------|
| OV6630 | COLOR Image Sensor, CIF, Digital, SCCB Bus Control | 48 pin LCC |
| OV6130 | B/W Image Sensor, CIF, Digital, SCCB Bus Control | 48 pin LCC |

3 Register Set

The table below provides a list and description of available SCCB registers contained in the OV6630/OV6130 image sensor. The device address for the OV6630/OV6130 is C1 for read and C0 for write.

Table 15 SCCB Registers

| Sub- address (hex) | Register | Default (hex) | Read/ Write | Descriptions |
|--------------------------|------------|---------------|----------------|---|
| 00 | GAIN | 00 | RW | AGC gain control GC[7:6] – Unimplemented. GC[5:0] – The current gain setting. |
| | | | | This register is updated automatically if AGC is enabled. The internal controller stores the optimal gain value in this register. The current value is stored in this register if AGC is not enabled. |
| 01 | BLUE | 80 | RW | Blue gain control BLU[7] – "0" decrease gain, "1" increase gain. BLU[6:0] – blue channel gain balance value. Note: This function is not available on the OV6130 image sensor. |
| 02 | RED | 80 | RW | Red gain control RED[7] – "0" decrease gain, "1" increase gain. RED[6:0] – red channel balance value. Note: This function is not available on the OV6130 image sensor. |
| 03 | SAT | 80 | RW | Color saturation control SAT[7:3] – Saturation adjustment. "F8h" is highest and "00h" is lowest. SAT[2:0] – Unimplemented. Note: This function is not available on the OV6130 image sensor. |
| 04 | Rsvd 04 | ×× | _ | Reserved |
| 05 | CTR | 48 | RW | Contrast control CTR[7] – selects gain at the dark area. "0" – gain=0.5 and "1" – gain=1. CTR[6:4] – reserved. CTR[3:0] – Contrast adjustment. "FFh" is highest and "00h" is lowest. |
| 06 | BRT | 80 | RW | Brightness control BRT[7:0] – Brightness adjustment. "FFh" is highest and "00h" is lowest. |
| 07 | SHP | C6 | RW | Sharpness control SHP[7:4] – Coring adjustment. Range: 0~80mV with step 5mV. SHP[3:0] – Strength adjustment. Range: 0~8× with step 0.5×. |
| 08-0B | Rsvd 08-0B | XX | ı | Reserved |
| 0C | ABLU | 20 | RW | White balance background: Blue channel ABLU[7:6] – rsvd ABLU[5] – "0" decrease background blue component, "1" increase background blue component ABLU[4:0] - White balance blue ratio adjustment Note: This function is not available on the OV6130 image sensor. |
| 0D | ARED | 20 | RW | White balance background: Red channel ARED[7:6] – rsvd ARED[5] – "0" decrease background red component, "1" increase background red component ARED[4:0] - White balance red ratio adjustment Note: This function is not available on the OV6130 image sensor. |
| 0E | COMR | 0D | RW | Common control R COMR[7] – Analog signal 2x gain control bit. "1" - Additional 2x gain, "0" - normal. COMR[6:0] – Reserved. |

| 0F | COMS | 05 | RW | Common control S COMS[7:6] – Reserved COMS[5:4] – select the lowest signal used in automatic black level expanding (or automatic brightness). "00" – lowest, "11" – highest and image is brighter. COMS[3:2] – select highest luminance level to be available in AWB control. "00" – lowest, "11" – highest. COMS[1:0] – select lowest luminance level to be available in AWB control. "00" – lowest, "11" – highest. |
|----|-------|----|----|--|
| 10 | AEC | 9A | RW | Automatic exposure control AEC[7:0] - Set exposure time $T_{EX} = 2 \times T_{LINE} \times AEC[7:0]$ |
| 11 | CLKRC | 00 | RW | Clock rate control CLKRC[7:6] – Sync output polarity selection "00" – HSYNC=Neg, CHSYNC=Neg, VSYNC=Pos "01" – HSYNC=Neg, CHSYNC=Neg, VSYNC=Neg "10" – HSYNC=Pos, CHSYNC=Neg, VSYNC=Pos "11" – HSYNC=Pos, CHSYNC=Pos, VSYNC=Pos CLKRC[5:0] – Clock pre-scaler CLK = (MAIN_CLOCK / ((CLKRC[5:0] + 1) × 2)) / n Where n=1 if register [3E], COMO<7> is set to "1" and n=2 otherwise. |
| 12 | COMA | 24 | RW | Common control A COMA[7] – SRST, "1" initiates soft reset. All registers are set to default values and chip is reset to known state and resumes normal operation. This bit is automatically cleared after reset. COMA[6] – MIRR, "1" selects mirror image COMA[5] – AGCEN, "1" enables AGC, COMA[4] – Digital output format, "1" selects 8-bit: Y U Y V Y U Y V COMA[3] – Select video data output: "1" - select RGB, "0" - select YCrCb COMA[2] – Auto white balance "1" - Enable AWB, "0" - Disable AWB COMA[1] – Color bar test pattern: "1" - Enable color bar test pattern COMA[0] – reserved |
| 13 | СОМВ | 01 | RW | Common control B COMB[7:6] – reserved COMB[5] - Select data format. "1" - select 8-bit format, Y/CrCb and RGB is multiplexed to 8-bit Y bus, UV bus is tri-stated, "0" - select 16-bit format COMB[4] – "1" - enable digital output in ITU-656 format COMB[3] – CHSYNC output. "1" - horizontal sync, "0" - composite sync COMB[2] – "1" – Tri-state Y and UV busses. "0" - enable both busses COMB[1] – "1" - Initiate single frame transfer. COMB[0] – "1" - Enable auto adjust mode. Note: COMB[5] is not programmable on the OV6130 image sensor. |
| 14 | COMC | 00 | RW | Common control C COMC[7:6] – reserved COMC[5] – QCIF digital output format selection. 1 - 176x144; 0 - 352x288. COMC[4] – Field/Frame vertical sync output in VSYNC port selection: 1 - frame sync, only ODD field vertical sync; 0 - field vertical sync, effect in Interlaced mode COMC[3] – HREF polarity selection: 0 - HREF positive effective, 1 - HREF negative. COMC[2] – gamma selection: 1 - RGB Gamma on; 0 - RGB gamma is 1. COMC[1:0] – reserved |
| 15 | COMD | 01 | RW | Common Control D COMD[7:2] – reserved bit. COMD[1] – PCLK polarity selection. "0" - OV6630/OV6130 output data at PCLK falling edge and data bus will be stable at PCLK rising edge; "1" - rising edge output data and stable at PCLK falling edge. This bit is disable and should use PCLK rising edge latch data bus in ITU-656 format (COMB[4]=1). COMD[0] – U V digital output sequence exchange control. 1 - UV UV · · · for 16-bit, |

| | 1 | | | U Y V Y · · · for 8-bit; 0 - V U V U · · · for 16-bit and V Y U Y · · · for 8-bit. |
|-------|------------|----|----|--|
| | | | | \cup Y V Y · · · for 8-bit; \cup - V \cup V \cup · · · for 16-bit and V Y \cup Y · · · for 8-bit. |
| | | | | Note: COMD[0] is not programmable on the OV6130 image sensor. |
| 16 | FSD | 03 | RW | Field slot division FSD[7:2] – Field interval selection. It has functional in EVEN and ODD mode defined by FSD[1:0]. It is disabled in OFF and FRAME mode. The purpose of FSD[7:2] is to divide the video signal into programmed number of time slots, and allows HREF to be active only one field in every FSD[7:2] fields. It does not affect the video data or pixel rate. FSD[7:2] disables digital data output, there is only black reference level at the output. FSD[7:2]=1 outputs every field. FSD[7:2]=2 outputs one field and disables one field, etc. FSD[1:0] – field mode selection. Each frame consists of two fields: Odd and Even, FSD[1:0] define the assertion of HREF in relation to the two fields. "00" – OFF mode; HREF is not asserted in both fields, one exception is the single frame transfer operation (see the description for the register 13) "01" – ODD mode; HREF is asserted in odd field only. "10" – EVEN mode; HREF is asserted in even field only. "11" – FRAME mode; HREF is asserted in both odd field and even field. FSD[7:2] disabled. |
| 17 | HREFST | 38 | RW | Horizontal HREF start HS[7:0] – selects the starting point of HREF window, each LSB represents two pixels for CIF resolution mode, one pixels for QCIF resolution mode, this value is set based on an internal column counter, the default value corresponds to 352 horizontal window. Maximum window size is 356. See window description below. HS[7:0] programmable range is [38] - [EB], and should less than HE[7:0]. HS[7:0] should be programmable to value larger than or equal to [38]. Value larger than [EC] is invalid. See window description below. |
| 18 | HREFEND | EA | RW | Horizontal HREF end HE[7:0] – selects the ending point of HREF window, each LSB represents two pixels for full resolution and one pixels for QCIF resolution, this value is set based on an internal column counter, the default value corresponds to the last available pixel. The HE[7:0] programmable range is [39] - [EC]. HE[7:0] should be larger than HS[7:0] and less than or equal to [EC]. Value larger than [EC] is invalid. See window description below. |
| 19 | VSTRT | 03 | RW | Vertical line start VS[7:0] – selects the starting row of vertical window, in full resolution mode, each LSB represents 1 scan line in one frame. See window description below. Min. is [03], max. is [93] and should less than VE[7:0]. |
| 1A | VEND | 92 | RW | Vertical line end VE[7:0] – selects the ending row of vertical window, in full resolution mode, each LSB represents 1 scan line in one frame, see window description below. Min. is [04], max. is [94] and should larger than VS[7:0]. |
| 1B | PSHFT | 00 | RW | Pixel shift PS[7:0] – to provide a way to fine tune the output timing of the pixel data relative to that of HREF, it physically shifts the video data output time late in unit of pixel clock as shown in the figure below. This function is different from changing the size of the window as defined by HS[7:0] and HE[7:0] in registers 17 and 18. Higher than default number delay the pixel output relative to HREF. The highest number is "FF" and the maximum shift number is delay 256 pixels. |
| 1C | MIDH | 7F | R | Manufacture ID byte: High MIDH[7:0] – read only, always returns "7F" as manufacturer's ID no. |
| 1D | MIDL | A2 | R | Manufacture ID byte: Low MIDL[7:0] – read only, always returns "A2" as manufacturer's ID no. |
| 1E-1F | Rsvd 1E-1F | ×× | RW | Reserved |
| 20 | COME | 00 | RW | Common control E COME[7] – HREF pixel number selection. "1" - HREF include 704 PCLK, every data output twice. COME[6] – reserved. COME[5] – "1" First stage aperture correction enable. Correction strength will be decided by register [07]. "0" disable first stage aperture correction. |

| | | | | COME[4] – "1" Second stage aperture correction enable. Correction strength and threshold value will be decided by COMF[7] ~ COMF[4]. COME[3] – AWB smart mode enable. 1 – do not count pixels that their luminance level are not in the range defined in register [0F]. 0 - count all pixels to get AWB result. Valid only when COMB[0]=1 and COMA[2]=1 COME[2] – reserved. COME[1] – AWB fast/slow mode selection. "1" - AWB is always fast mode, that is register [01] and [02] is changed every field. "0" AWB is slow mode, [01] and [02] change every 16/64 field decided by COMK[1]. When AWB enable, COMA[2]=1, AWB is working as fast mode until it reaches stable, than as slow mode. COME[0] – Digital output driver capability increase selection: "1" Double digital output driver current; "0" low output driver current status. |
|----|------|----|----|---|
| | | | | Note: COME[3] (AWB smart mode), COME[2] (AWB stop), and COME[1] (AWB fast/slow) are not programmable on the OV6130 image sensor. |
| 21 | YOFF | 80 | RW | Y channel offset adjustment YOFF[7] – Offset adjustment direction 0 - Add Y[6:0]; 1 -Subtract Y[6:0]. YOFF[6:0] –Y channel digital output offset adjustment. Range: +127 ~ -127. If COMG[2]=0, this register will be updated by internal circuit. Write a value to this register through SCCB has no effect. COMG[2]=1, Y channel offset adjustment will use the stored value which can be changed through SCCB. This register has no effect to A/D output data if COMF[1]=0. If output RGB raw data, this register will adjust R/G/B data. |
| 22 | UOFF | 80 | RW | U Channel offset adjustment UOFF[7] – Offset adjustment direction: 0 - Add U[6:0]; 1 - Subtract U[6:0]. UOFF[6:0] – U channel digital output offset adjustment. Range: +128 ~ -128. If COMG[2]=0, this register will be updated by internal circuit. Write a value to this register through SCCB has no effect. COMG[2]=1, U channel offset adjustment will use the stored value which can be changed through SCCB. This register has no effect to A/D output data if COMF[1]=1. If output RGB raw data, this register will adjust R/G/B data. |
| | | | | Note: This function is not available on the OV6130 image sensor. |
| 23 | CLKC | 04 | RW | Oscillator circuit control CLKC[7:6] – Select different crystal circuit power level ("11" = minimum). CLKC[5:0] – reserved |
| 24 | AEW | 33 | RW | Automatic exposure control: Bright pixel ratio adjustment AEW[7:0] – Used as calculate bright pixel ratio. OV6630/OV6130 AEC algorithm is count whole field bright pixel (its luminance level is higher than a fixed level) and black pixel (its luminance level is lower than a fixed level) number. When bright/black pixel ratio is same as the ratio defined by register [25] and [26], image stable. This register is used to define bright pixel ratio, default is 25%, each LSB represent step: 0.5% Change range is: [01] ~ [CA]; Increase AEW[7:0] will increase bright pixel ratio. For same light condition, the image brightness will increase if AEW[7:0] increase. |
| | | | | Note: $AEW[7:0]$ must combine with register [26] $AEB[7:0]$. The relation must be as follows: $AEW[7:0] + AEB[7:0] > [CA]$. |
| 25 | AEB | 97 | RW | Automatic Exposure Control: Black pixel ratio adjustment AEB[7:0] – used as calculate black pixel ratio. OV6630 AEC algorithm is count whole field/ frame bright pixel (its luminance level is higher than a fixed level) and black pixel (its luminance level is lower than a fixed level) number. When bright/black pixel ratio is same as the ratio defined by register [25] and [26], image stable. This register is used to define black pixel ratio, default is 80%, each LSB represent step: 0.5%; Change range is: [01] ~ [CA]; Increase AEB[7:0] will increase black pixel ratio. For same light condition, the image brightness will decrease if AEB[7:0] increase. |
| | | | | Note: AEB[7:0] must e combined with register [25] AEW[7:0]. The relation must be as follows: $AEW[7:0] + AEB[7:0] > [CA]$. |
| 26 | COMF | В0 | RW | Common control F |

| - | | | | |
|----|-------|----|----|--|
| | | | | COMF[7:4] – reserved. COMF[3] – UV offset difference. "1" use separate offsets for U and V; "0" use one offset for both U and V. COMF[2] – Digital data MSB/LSB swap. "1" LSB→bit7, MSB→bit0; "0" normal. COMF[1] – "1" digital offset adjustment enable. "0" disable. COMF[0] – "1" Output first 4 line black level before valid data output. HREF number will increase 4 relatively. "0" no black level output. |
| 27 | COMG | A0 | RW | Common control G COMG[7:6] – reserved COMG[5] - Select CKOUT pin output V flag. "1" - CKOUT output V flag signal. CKOUT=1 if UV channel output V or Red. CKOUT=0 if UV channel output U or BLUE. "0" - CKOUT output buffered XCLK2 COMG[4:3] – reserved. COMG[2] – "1" digital offset adjustment manually mode enable. Digital data will be add/subtract a value defined by register [21] and [22], the contents are programmed through SCCB. "0" - digital data will be added/subtract a value defined by register [21] and [22], which are updated by internal circuit. COMG[1] – Digital output full range selection. OV6630/OV6130 default output data range is [10] - [F0]. The output range changes to [01] - [FE] with signal overshoot and undershoot level if COMG[1]=1. COMG[0] – reserved. |
| 28 | СОМН | 01 | RW | Common control H COMH[7] - "1" selects one-line RGB raw data output format, "0" selects normal two-line RGB raw data output. COMH[6] - "1" enable black/white mode. The vertical resolution will be higher than color mode when the imager works as BW mode. OV6630/OV6130 can't work at 8-bit output in this mode. OV6630/OV6130 outputs data from Y port. UV port will be tri-state. COMB[5] and COMB[4] will be set to "0". "0" normal color mode. COMH[5] - reserved. COMH[4] - Freeze AEC/AGC value, effective only at COMB[0]=1. "1" - register [00] and [10] will not be updated and hold latest value. "0" - AEC/AGC normal working status. COMH[3] - AGC disable. "1" - when COMB[0]=1 and COMA[5]=1, internal circuit will not update register [00], register [00] will kept latest updated value before COMH[3]=1. "0" - when COMB0=1 and COMA[5]=1, register [00] will be updated by internal algorithm. COMH[2] - RGB raw data output YG format: "1" - Y channel G, UV channel B R; "0" - Y channel: G R G R · · · , UV channel B G B G · · · COMH[1] - Gain control bit. "1" channel gain increases 6dB. "0" no change to the channel gain. COMH[0] - reserved. |
| 29 | COMI | 00 | RW | Common control I COMI[7] – AEC disable. "1" If COMB[0]=1, AEC stop and register [10] value will be held at last AEC value and not be updated by internal circuit.
